

Best Way to Use *Fable*

Fable is for judgment embedded in execution.

1 Audit + handoff

Get the verdict first, then hand off the build.

- **"I'm a vibe coder"** reviewing my codebase before I scale the team — Fable says what's load-bearing, what's rotten, what to rebuild, then writes the plan junior devs run.
- **"I'm a consultant"** — audit an entire sales process, hand ops a playbook they run without me.

3 Adversarial review

Find the gaps. Make your argument stronger.

- **"I'm a PhD candidate"** — red-team my defense for the committee's kill question.
- **"I'm on a policy team"** — run the proposal against the opposition's strongest case, not the strawman.

5 Synthesis-heavy analysis

Find the insight that's in no single source.

- **"I'm a product manager"** — fifty interviews compressed by cheaper models, then: what do customers want that nobody asked about?
- **"I'm prepping the board"** — metrics, reports, market signals in; the one trend the dashboards hide back out.

2 Grounded ambiguity

Triangulate when the data weakly supports everything.

- **"I'm a growth lead"** — flat growth, three theories (pricing, ICP, onboarding) the data weakly supports. Which fits? What cheap test tells them apart?
- **"I'm head of strategy"** — three plausible bets, evidence pointing every direction. Which holds up, and what would prove the others wrong?

4 Asymmetric decisions

When the cost of being wrong is high.

- **"I'm a technical founder"** — choosing a database or framework for a product meant to live ten years.
- **"I'm a solo founder"** — whether to take the acquisition offer, or make my first hire.

6 Judgment-embedded execution

Turn expertise into product — no intermediary.

- **"I'm a domain expert with no eng team"** — describe a tool in two paragraphs and get production-quality software where every unspecified decision was made well.
- **"I'm an operator"** — I need an internal pricing calculator or intake app, and ship it from a plain-language brief without a developer.
